

News Application

Overview

Application for users to check the latest news and articles using [newsapi](#). Users can also manage their subscription to certain sources of news to get the latest feed from them only.

User journey

- User register in the application using the following data:
 - fullName
 - Email
 - Password
- Users can login using email and password.
- There are two pages: home and sources.
- Users can log out.
- The user can see a list of all the news & articles from the subscribed sources([news API](#)).
- The user can see a list of sources where he can subscribe or unsubscribe to any of them([sources API](#)).

Tools

- Node.js (use express or fastify)
- MongoDB
- <https://newsapi.org/>

Requirements

- Design RESTful APIs for the functionalities mentioned in the user journey.
- Integration with the [newsapi](#) should be from the backend of the application.
- Don't use the newsapi.org 3rd party library.

PS: Pay attention to clean code and **performance**.

PS: Just implement the backend for this task only.
